Tiger Technology

Sovereign file data, under your control

Tiger Bridge is EU-owned file data management software that extends the file servers you already run to any sovereign cloud. It tiers, replicates, syncs, protects and archives your files on any storage you choose, in open, non-proprietary format.

Boost your sovereignty score with storage-agnostic software

You decide where your file data lives and who can reach it. Users keep working as before, nothing is replaced, and you can change provider whenever laws, suppliers or prices change.

Seamless migration

Migrate in the background while people keep working. Downtime in minutes, not days.

Hybrid cloud data management

Tier, protect, sync and archive across the file servers you already run.

Complete freedom

Your keys, your format, any provider. Switch whenever laws or suppliers change.

1. Move to sovereign storage

No lock-in. Your file data stays in open, non-proprietary format wherever you store it. We move it from your servers to EU cloud, object storage or tape, and off other non-EU file platforms.

STEP 1 — **Assess**

We map your footprint and recommend the right target.

STEP 2 — **Move**

File data copies in the background while users keep working.

STEP 3 — **Verify**

Compare source and target to validate data consistency.

STEP 4 — **Cut over**

One configuration change. Users see no difference.

2. Maintain sovereignty

No one outside your organisation can reach your file data, including Tiger.

1	Data kept in the EU	Choose EU storage and decide where each data category lives; placement, replication and tiering follow your policies, not a provider's defaults.
2	Independence from third countries	No foreign-law route to your data, and no US policy decision can cut you off from your files.
3	No US control	EU-owned, with support from inside the EU.
4	Control that stays with you	Files can be encrypted with keys only you hold. Tiger has no access to your data or cloud credentials.

3. Keep your freedom

After migration, Tiger Bridge can continue managing your data.

- **Switch providers easily**
  Change your storage back end whenever you choose, without touching file servers or users. Works with any S3-compatible, cloud, tape or on-premises target.
- **Keep your native format**
  Files stay in their original format wherever they are stored, so no proprietary layer holds your data hostage.
- **Nothing to rip out**
  Tiger Bridge runs on the file servers you already have, so users keep the same files, folders and permissions whatever storage sits behind them.
- **Continuity and disaster recovery**
  Keep a second or third copy of your most critical data at another site or in an EU cloud, so you can recover if a site or provider fails.

>60%
lower storage cost

10X
up to ten times better use of storage you own

10X
up to ten times faster recovery

Minutes
of migration downtime, not hours or days
